[1] See Appendix C for complete titles and area definitions of the SMSA's and LMA's in these tables.

Appendix C. Geographic Boundary Definitions for 30 Large Metropolitan Areas

This appendix lists the boundary definitions of 30 large metropolitan areas using the two methods by which the areas are defined for statistical purposes—Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Department of Labor has used LMA's for a number of years for various administrative and program purposes. Designed to measure conditions of the labor force within reasonable commuting distance of a large central city (or cities), the boundaries for almost all LMA's are the same as those for SMSA's as defined by the Office of Federal Statistical Policy and Standards. SMSA boundaries are defined using a set of uniform criteria, while LMA's are defined jointly by the State Employment Security Agencies and the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

An SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The tables that follow compare the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's, while those in section IV refer to LMA's.

Since 1973, the New York SMSA has consisted of the five counties included in New York City, and Rockland, Westchester, and Putnam Counties in New York State, plus Bergen County, New Jersey. Before 1973, the New York SMSA did not include Putnam or Bergen County. On the other hand, the New York Labor Market (LMA) has, for many years, included Putnam County, but excluded Bergen County. Bergen County had a labor force of 484,000 in 1980, equal to approximately 12 percent of the New York SMSA. However, Putnam County has a labor force comprising less than 1 percent of the total. Thus the current New York LMA is consistent with the 1970 SMSA definition. Data based on the SMSA definition are available upon request.

Estimates for the Minneapolis-St. Paul LMA as published in this year's report are not significantly different from those for the SMSA. Consequently, earlier data based on the SMSA definition may be used in a time series with the current LMA data.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
Anaheim-Santa Ana-Garden Grove ..	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis.....	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same

See footnotes at end of table.

150

Table C-1. Continued—Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] Except for Denver-Boulder, for which the estimates in section III are based on the 1973 SMSA geographic boundaries, all metropolitan area estimates in sections III and IV are based on the LMA boundaries.

151

Appendix D. Procedures for Estimating Employment and Unemployment Under the Federal-State Cooperative Program

Estimating methods

Employment and unemployment estimates for the 10 largest States (California, New York, Texas, Illinois, Pennsylvania, Ohio, Michigan, Florida, New Jersey, and Massachusetts) and two areas (New York City and the Los Angeles–Long Beach LMA) are taken directly from the Current Population Survey (CPS). For a description of CPS concepts, see the BLS periodical *Employment and Earnings*, Explanatory Note A, "Household Data."

Estimates for the remaining 40 States and the District of Columbia are prepared by State employment security agencies under standardized procedures developed by the Bureau of Labor Statistics. The estimates are prepared in several stages, as explained below.

Labor force and unemployment estimates for States, Labor Market Areas (LMA's), and other areas covered under Federal assistance programs are developed by State employment security agencies under a Federal-State cooperative program. The local unemployment estimates which are derived from standardized procedures developed by BLS are the basis for determining eligibility of an area for benefits under Federal programs such as the Comprehensive Employment and Training Act and the Public Works and Economic Development Act.

Preliminary estimate—employment

The total employment estimate is based primarily on data from the survey of establishments which produces an estimate of payroll employment. This place-of-work estimate must be adjusted to refer to place of residence as used in the CPS. Factors for adjusting from place of work to place of residence have been developed for the major categories of employment by class of worker and industry on the basis of employment relationships which existed at the time of the 1970 Decennial Census. These factors are applied to the payroll employment estimates for the current period to obtain adjusted employment estimates.

Estimates of employment for workers not covered by the payroll survey, such as agricultural workers and self-employed and unpaid family workers, are also developed using special surveys, national historical relationships, and census data.

Preliminary estimate—unemployment

In the current month, the estimate of unemployment is an aggregate of the estimates for each of three categories: (1) Persons who were previously employed in industries covered by State UI laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation. This is referred to below as the UI-based estimate.

An estimate for those previously employed in covered industries is derived from a count of current unemployment insurance claimants, plus estimates of claimants whose benefits have been exhausted, those persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but would otherwise have been eligible), and persons who either filed claims late or not at all.

The estimate of those previously employed in industries not covered by UI is derived by applying to the employment estimate for each noncovered industry or class of worker subgroup in the State the ratio of covered unemployment to covered employment, weighted by factors reflecting national historical relationships.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate the total entrants into the labor force to the experienced unemployed and the experienced labor force. For each month, the estimate of entrants into the labor force is a function of: (a) the month of the year; (b) the level of the experienced unemployed; (c) the level of the experienced labor force; and (d) the proportion of the working-age population that is considered "youth." The composite estimate of total entrants is defined as:

$U = A(X+E) + BX$, where

U = total entrant unemployment
E = total employment
X = total experienced unemployment

A, B = synthetic factors incorporating seasonal variations and an assumed relationship between the proportion of youths in the working population and the historical relationship of entrants to the experienced unemployed (B factor) or the experienced labor force (A factor)

Correction factors

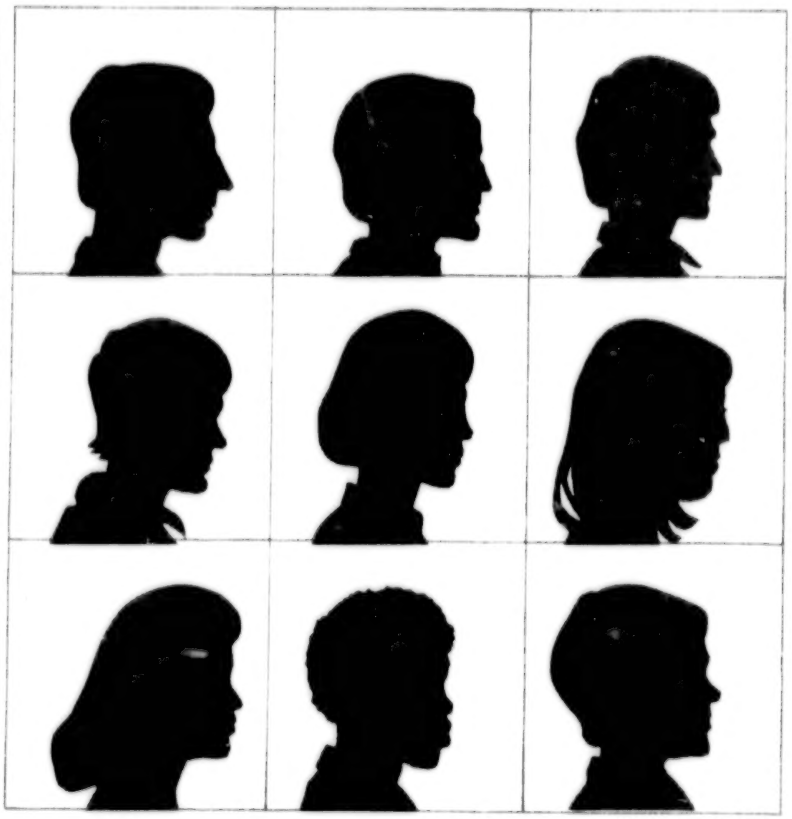
Correction factors are then applied at the State level to the UI-based estimates obtained above for each of the 40 States and District of Columbia. These correction factors are based on the ratio of the CPS to the UI-based estimates for the 6-month period ending in the current month (e.g., a 6-month moving average).

Sub-State adjustment for additivity

Independent estimates of employment and unemployment are prepared both for the State (obtained directly from the CPS in 10 large States or by the UI-based method in the remaining States), and labor market areas (LMA's) within the State. The total labor force included in the LMA's exhausts the geographic boundaries of the State. A proportional adjustment is applied to all sub-State LMA estimates to ensure that the sub-State estimates of employment and unemployment add to the independent State totals. In California and New York, which also have sub-State areas taken directly from the CPS, the additivity adjustment for the remaining areas is applied to the State total minus the direct CPS area.

Benchmark correction procedures

Once each year monthly estimates prepared by State employment security agencies using UI-based estimating procedures are adjusted, or benchmarked, by BLS to the annual average CPS estimates for the 40 States for which monthly CPS estimates are not available. This adjustment is necessary because the State-prepared estimates are not as reliable as the CPS annual averages due to differences in State UI laws, the structural limitations of the UI-based estimating method, and errors in the UI data.



The benchmarked estimates are produced in three stages. First, the monthly UI-based estimates are adjusted by the ratio of the CPS to the UI-based annual averages. Second, the difference between the ratio of annual averages for two consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the second-stage estimates are forced into agreement with CPS annual averages. In the 10 States which use CPS estimates monthly, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal the CPS annual averages.

The CPS estimates in the 10 large States and two large areas are adjusted each year to incorporate revised independent population estimates provided by the Bureau of the Census. These revised population estimates affect the levels of employment and unemployment, but do not affect the unemployment rates.

The estimates for LMA's in section IV have been adjusted to conform to CPS annual averages estimates for the States.

Youth Unemployment: An International Perspective

Bulletin 2098 from the Bureau of Labor Statistics examines the labor market experiences of youth—from the early 1960's to the late 1970's—in the United States and eight other industrial countries.

Australia
Canada
France
Germany
Great Britain
Italy
Japan
Sweden

The size of the youth unemployment problem and the underlying reasons for large international differences in youth unemployment are highlighted.

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program. This bulletin presents data from the CPS for regions, States, and selected large metropolitan areas and central cities. It provides 1981 annual averages for the employed and the unemployed by demographic and economic characteristics based on population counts projected from the 1980 decennial census. In addition, an appendix provides revised 1980 annual average CPS data based on population counts from the 1980 decennial census for major demographic groups. Finally, data are provided to enable users to revise earlier data to reflect 1980 decennial census information.

Data for earlier years based on the 1970 decennial census were published in the following reports: *Geographic Profile of Employment and Unemployment, 1975* (Report 481), and *1976* (Report 504); *State Profile of Employment and Unemployment, 1977* (Report 539); *Geographic Profile of Employment and Unemployment: States, 1978, Metropolitan Areas, 1977-78* (Report 571); *Geographic Profile of Employment and Unemployment, 1979* (Report 619) and *1980* (Bulletin 2111).

The official Bureau of Labor Statistics (BLS) estimates for States, metropolitan areas, and central cities, which are the basis for determining eligibility of an area for benefits under Federal economic assistance programs, are developed from the Federal-State Cooperative Program. For all States, the Los Angeles Standard Metropolitan Statistical Area (SMSA), and New York City, the official annual average estimates are obtained directly from the CPS. For the remaining metropolitan areas and cities, the official annual average estimates are derived from a standardized procedure developed by BLS. Data from the CPS for metropolitan areas and cities in this bulletin are not the official BLS estimates and are provided because they are the only source of information on demographic and economic characteristics.

New data presented in this issue include estimates by detailed demographic characteristics for the four Census regions and nine divisions; data by industry and reason for part-time work for States; and data by industry for metropolitan areas and central cities. Data for two metropolitan areas, New York and Minneapolis-St. Paul, relate to the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA) definition. For further information on geographic areas, see appendix C.

This bulletin was prepared in the Division of Local Area Unemployment Statistics by Sandy Grove, Vernon Irby, Denis Keyes, William L. Salvatore, George Schreider, and Linda Blount, under the supervision and direction of Fred Cronkhite.

Material in this publication is in the public domain and may, with appropriate credit, be reproduced without permission.

Section I. Estimates for Census regions and divisions 2
Tables: Census regions and divisions, 1981 annual averages:
1. Labor force status of the civilian noninstitutional population 16 years and over by sex, age, race, Hispanic origin, and marital status 3
2. Full- and part-time status of the civilian labor force 16 years and over by sex, age, and race 8
3. Employment status of the experienced civilian labor force by occupation 10
4. Occupational distribution of employment by sex, age, and race 12
5. Employment status of experienced nonagricultural wage and salary workers excluding private household workers by industry 15
6. Industry distribution of nonagricultural wage and salary employment excluding private household workers by sex, age, and race 17
7. Persons at work by hours of work, sex, age, and race 20
8. Persons at work 1-34 hours by reason, sex, age, and race 22
9. Persons with a job but not at work by reason, sex, age, and race 24
10. Distribution of unemployed persons by reason for unemployment, sex, age, and race 26
11. Distribution of unemployed persons by duration of unemployment, sex, age, and race 28

Section II. Estimates for States 30
Charts:
1. Changes in State unemployment rates, 1980-81 31
2. Unemployment rates by State, 1981 annual averages 31

Tables: States, 1981 annual averages:
12. Labor force status of the civilian noninstitutional population 16 years and over by sex, age, race, Hispanic origin, and marital status 32
13. Full- and part-time status of the civilian labor force 16 years and over by sex, age, race, and Hispanic origin 49
14. Employment status of the experienced civilian labor force by occupation 54
15. Occupational distribution of employment by sex, age, race, and Hispanic origin 58
16. Employment status of the experienced civilian labor force by industry 63
17. Industry distribution of employment by sex, age, race, and Hispanic origin 66
18. Persons at work by hours of work, sex, age, and race 71
19. Persons at work 1-34 hours by reason, sex, age, and race 76
20. Persons with a job but not at work by reason 80
21. Distribution of unemployed persons by reason for unemployment, sex, age, race, and Hispanic origin 81
22. Distribution of unemployed persons by duration of unemployment, sex, age, race, and Hispanic origin 85

Section III. Estimates for metropolitan areas and cities 89
Tables: Metropolitan areas and cities, 1981 annual averages:
23. Labor force status of the civilian noninstitutional population 16 years and over by sex, age, race, Hispanic origin, and marital status 90
24. Employment status of the experienced civilian labor force by occupation 104
25. Occupational distribution of employment by sex, age, race, and Hispanic origin 107
26. Employment status of experienced nonagricultural workers by industry 112
27. Distribution of nonagricultural employment by industry, sex, age, race, and Hispanic origin 115

Appendixes:
A. Definitions of data derived from the Current Population Survey 120
B. Sampling and estimation procedures and sampling error tables 122
C. Geographic boundary definitions 154
D. Selected demographic data for 1980 for all States adjusted to reflect the 1980 Census population count 158
E. Population estimates for 1970-79 based on the 1980 census population count 177

Geographic Profile of Employment and Unemployment, 1981

The Current Population Survey (CPS) is the regular monthly survey of about 60,000 households from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures.) Annual average estimates of the demographic characteristics of the labor force (age, sex, and race) and the economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standard of reliability for publication. (See appendix B for an explanation of the BLS standard for publication of CPS data.) Estimates for the regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error.[1] Error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

[1] The CPS estimates in this report reflect the 1980 census population counts. See appendixes D and E for more details.

Other marital status[3]	4,321	2,421	56.0	2,215	51.3	206	8.5	7.6 - 9.4

[1] Regional data are limited for population of Hispanic origin. See State and metropolitan area tables for more detailed data on the Hispanic-origin population in selected areas.

[2] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding.

Table 2. Census regions and divisions: Full- and part-time status of the civilian labor force 16 years and over by sex, age, and race, 1981 annual averages

[1] Persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular State, based on the sample in the State. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Numbers may not add to totals because of rounding.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1981 annual averages

[1] Excludes persons with no previous full-time work experience.

[2] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding.

[1] Excludes persons with no previous full-time work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes private household workers and mining.

[4] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[5] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding.

[1] Includes industrial disputes.
[2] Does not want, or unavailable for, full-time work.
[3] Less than 500 persons or less than 0.05 percent.
[4] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.
- Data not available.
NOTE: Numbers may not add to totals because of rounding.

Married, spouse present	143	87	60.6	81	56.6	6	6.7	3.6	- 9.8

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated and married with spouse absent.

[3] These data are for the Labor Market Areas (LMA) rather than the Standard Metropolitan Statistical Area for which estimates were published in earlier years. The differences are discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Table 24. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force by occupation, 1981 annual averages

[1] Excludes persons with no previous full-time work experience.

[2] Includes farm workers.

[3] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[4] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[5] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding.

Table 25. Selected metropolitan areas and cities: Occupational distribution of employment by sex, age, race, and Hispanic origin, 1981 annual averages

(Percent of total employment)

[1] Includes farm workers

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to total because of rounding. Data are not shown separately for racial and ethnic groups when the employment estimate for these groups is not sufficiently large to meet BLS publication standards of reliability for the particular area, based on the sample size in that area. See appendix B.

Table 26. Selected metropolitan areas and cities: Employment status of experienced[1] nonagricultural workers by industry, 1981 annual averages

(Numbers in thousands)

[1] Excludes persons with no previous full-time work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes private household workers and mining.

[4] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[5] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

NOTE: Items may not add to subtotals because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers, and mining.

[2] Includes private household workers and mining.

[3] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[4] Less than 500 persons employed or less than 0.05 percent of total employed.

- Data not available.

NOTE: Data are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force (the total of the employed and the unemployed), unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days, are also counted as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking.

Reasons for unemployment are divided into four major groups:

(1) Job losers—persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

Persons who worked 35 hours or more in the survey week are designated as working *full time*; correspondingly, persons who worked between 1 and 34 hours are designated as working *part time*. Part-time workers are classified by their usual status at their present job (either full- or part-time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. Other reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, housework, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The *full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (part time for economic reasons), and unemployed persons seeking full-time jobs. The *part-time labor force* consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Occupation and industry data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. *The classifications of occupations and industries used in this bulletin are as defined in the 1970 census.*

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who

were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week, with all hours credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

Race and ethnic origin. Beginning with the 1981 annual averages, the *Geographic Profile* is presenting racial data for white and black workers. This is a change from previous issues, in which the latter racial group was the broader "black and other" category. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders. Hispanic origin refers to person who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent, regardless of race. Estimates of sampling errors in this report for the Hispanic population are based upon those for the "black and other" population. However, since the Hispanic population is smaller, estimates for this group are likely to have a wider error range. Therefore, caution should be exercised in making comparisons using these data.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*, BLS Report 463.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population.[1] The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. During 1981, over 60,000 occupied housing units were eligible for interview each month. Respondents are interviewed to obtain information about the employment status of each household member 16 years of age and over for the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; persons under 16 are excluded from the population and labor force statistics shown in this bulletin.

Sampling procedures

The current sample encompasses 629 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia, and is based to a large extent on information about the distribution of the population as reported in the 1970 decennial census. These areas were selected by dividing the entire area of the United States into 1,931 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Each of the SMSA's defined as of the 1970 census constitutes a separate PSU.

[1] For a technical description of the CPS sampling and estimation procedures and variance estimation procedures, see Technical Paper 40, *The Current Population Survey Design and Methodology* (Bureau of the Census, January 1978.)

To improve the efficiency of the sample, the 1,931 PSU's were grouped into strata. PSU's in strata by themselves are self-representing (SR), and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population density and growth, proportion of nonwhites, principal industry, and number of farms. PSU's selected from these strata are nonself-representing (NSR), since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected. These are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses to be enumerated within each designated ED are selected. Whenever possible, the four units are contiguous.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to avoid the poor cooperation which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

The basic weights, which are the inverse of the sampling ratios, are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to the extent needed to account for occupied sample households for which no

information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

   a. *First-stage ratio estimate.* As explained above, NSR areas are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1970 census between the distribution of the population by race and residence in the NSR sample areas and the corresponding distribution in the entire geographic area from which the NSR areas were selected. The procedure is performed twice, once at the regional level for the 4 Census regions and then for each of the 46 States which contain NSR areas. The first-stage adjustment factors are derived using the NSR PSU's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

   b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent estimate of the entire U.S. population, and is conducted in two steps. In the first step, the sample estimates for all age-sex-race groups within each State and the District of Columbia are prorated to an independent estimate of the population 16 years and over for that State. The second step is applied to a specific age-sex-race group for sample persons across all States and is a weighting of estimates from the first step to a nationwide independent estimate of the civilian noninstitutional population for each of 68 age-sex-race groups. Beginning with the 1981 annual averages, the race groups used in this step have been changed from white/nonwhite to black/nonblack. (See appendix A.)

      The entire second-stage ratio estimation procedure is iterated six times, and, when completed, insures that adjusted sample population estimates, both for the States and the national age-sex-race categories, will be virtually equal to the independent population estimates for these categories.

      The independent State controls for the civilian noninstitutional population 16 years and over are an arithmetic extrapolation of the trend in their growth from the April 1, 1980 census count through the latest available July 1 State estimate, prorated to a current estimate of the U.S. population. A description of the methodology used to derive the independent national age-sex-race estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the final statistics for a given month, a composite estimating procedure is used which takes account of net changes in the sample results from the previous month for the continuing households of the sample (75 percent), as well as the sample results from all households for the current month. Almost all estimates of month-to-month changes are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled, and hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Vermont approximately 1 in every 300 households was sampled each month in 1981, whereas in New York the sample covered about 1 in every 1,600 households. Nevertheless, the size of the sample in New York is 6 times larger than in Vermont because New York has a larger percentage of the national population.

Prior to 1976, the sampling ratio for each household was the same in each State, approximately 1 in 1,500. Since then, the samples have been augmented in many of the smaller States to improve the reliability of the CPS data. This augmentation has affected the sampling ratios in these States, so now the probability of selecting a particular household varies considerably from State to State.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6-percent unemployment rate. Before CPS labor force data

for a State or area can be used as the official estimates in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for States, SMSA's, and cities, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas, in which critical cells must contain at least 30 sample cases for the publication of data. In addition, estimates are not published when they do not meet the comparable minimum publication standard for national CPS data. As a result of these two requirements, minimum bases for publication have been developed for each area. Table B-1 lists the minimum necessary base for publication of data in each of the regions, States, and metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, it is the size of the labor force of the particular population group that determines whether data for that group are published. In all other tables, the determining factor is the size of the base of the distribution—i.e., the size of total employment or unemployment. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-25) can be used directly to develop 90-percent confidence intervals for sample estimates. (A sampling error equals 1.645 times one standard error.) They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-10 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 9,000, and a relative sampling error of 18 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 13,000 and a relative sampling error of 13 percent.

The statement that unemployment in Alabama is between 41,000 and 59,000 in the first instance, and between 87,000 and 113,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (two chances out of three), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 9,000. At 68-percent confidence, the error would be about 5,400 (9,000 X 0.6 = 5,400). At 95-percent confidence, the error would be about 10,700 (9,000 X 1.19 = 10,710).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1980 to 1981 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where: E_1 = the sampling error of one group or year
E_2 = The sampling error of another group or year
C = the covariance (or relationship) term between E_1 and E_2
E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. However, the tables in this *Profile* should also be used to compute sampling errors for the 1980 annual average data found in appendix D. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10.0 percent to 8.0 percent between 1979 and 1981 is significant. Assume that the labor force was about 100,000 in both years. Table B-8 in the 1979 *Geographic Profile* gives the error for a 10.0-percent unemployment rate as 1.11, and table B-14 in this year's *Geographic Profile* gives the error for

an 8.0-percent unemployment rate as 1.40. Using the formula described above, the following would result:

$$E_1 = 1.11 \qquad E_2 = 1.40$$

$$E_1^2 + E_2^2 = 3.1921$$

$$\sqrt{3.1921} = 1.79$$

Assuming a negligible "C" term, the error of the difference is about 1.8. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-10 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_s = [[(S - G)(F - G)] \times (X - Y)] + Y$$

where:
- F = published size immediately above the size desired (200,000)
- G = published size immediately below the size desired (100,000)
- S = size desired (150,000)
- X = error of the F (18,000)
- Y = error of G (13,000)
- E_s = error of S (15,500)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from BLS on request.

Appendix C. Geographic Boundary Definitions

This appendix lists the States composing the Census divisions and regions. It also provides the geographic definitions of Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Census regions and divisions and the States they comprise are:

Northeast
- New England
  - Maine
  - New Hampshire
  - Vermont
  - Massachusetts
  - Rhode Island
  - Connecticut
- Middle Atlantic
  - New York
  - New Jersey
  - Pennsylvania

North Central
- East North Central
  - Ohio
  - Indiana
  - Illinois
  - Michigan
  - Wisconsin
- West North Central
  - Iowa
  - Missouri
  - Nebraska
  - Kansas
  - Minnesota
  - North Dakota
  - South Dakota

South
- South Atlantic
  - Delaware
  - Maryland
  - District of Columbia
  - Virginia
  - West Virginia
  - North Carolina
  - South Carolina
  - Georgia
  - Florida
- East South Central
  - Kentucky
  - Tennessee
  - Alabama
  - Mississippi
- West South Central
  - Arkansas
  - Louisiana
  - Oklahoma
  - Texas

West
- Mountain
  - Montana
  - Wyoming
  - Colorado
  - Utah
  - Idaho
  - Arizona
  - Nevada
  - New Mexico
- Pacific
  - California
  - Hawaii
  - Washington
  - Oregon
  - Alaska

The Department of Labor has used LMA's for a number of years for various administrative and programmatic purposes. The boundaries for almost all LMA's are the same as those for SMSA's, as established by the Office of Management and Budget. SMSA boundaries are defined using a specific set of criteria developed for that purpose. LMA's are determined by the State employment security agencies, using rules established by the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

In general, an SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socialy related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are

composed of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The table that follows compares the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
Anaheim-Santa Ana-Garden Grove ..	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same

See footnotes at end of table.

Table C-1. Continued—Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] Except for Denver-Boulder, for which the estimates are based on the 1973 SMSA geographic boundaries, all metropolitan area estimates are based on the LMA boundaries.

Appendix D. Selected Demographic Data for 1980 for All States Adjusted to Reflect the 1980 Census Population Count

This appendix contains selected 1980 annual average data for States from the CPS revised to incorporate population counts from the 1980 census. The revision process entails replacing the 1970-based population estimates used in the second-stage ratio estimation process (see appendix B) with new population estimates based on the 1980 census counts, and then recomputing the weighted estimates. To compute annual averages, population estimates for each month of 1980 were replaced. Additionally, the race categories used in the second-stage adjustment process were changed from white/nonwhite to black/nonblack in order to make the 1980 annual averages consistent with those for 1981.

The CPS data in this appendix also reflect a small sample reduction which primarily occurred in the larger States. The reduced-sample estimates for 1980 are more consistent with annual average data for both 1979 and 1981. CPS data for SMSA's for 1980 rebased to the 1980 census population counts are not available.

Table D-1. States: Labor force status of the civilian noninstitutional population 16 years and over by sex, age, and race,[1] adjusted to reflect 1980 Census population counts, 1980 annual averages

(Numbers in thousands)

[1] The data in this table are comparable to 1980 data published last year in tables 1 and 9 of the *Geographic Profile of employment and unemployment, 1980* ,Bulletin 2111. Data for the Black and other racial classification, adjusted to the 1980 Census population counts, are not available.

[2] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Appendix E. Population Estimates for 1970-79 for All States Based on the 1980 Census Population Count

This appendix contains estimates of the civilian noninstitutional population 16 years of age and over for States for the years 1970 through 1979 which have been revised to reflect the undercoverage of the population found in the 1980 decennial census. These population estimates are provided to enable readers to revise CPS data published in previous issues of *Geographic Profile* in order to make them consistent with 1980 and 1981 annual average data published in this issue.

In general, these population estimates were developed from a procedure which corrected the difference between the April 1980 population estimate for each State projected from the 1970 decennial census and the actual April 1980 decennial census count for that State. This so-called "error of closure" method had an adjustment of zero in April 1970 and an adjustment equal to the difference, or error, between the actual and projected population estimates in April 1980.

These population estimates can be used to adjust level estimates found in earlier *Geographic Profile* reports. Rates and percentage distributions will not be affected by these population revisions, and hence, need *not* be adjusted.

To adjust levels, use the following formula:

$$\frac{Pr}{Po} \cdot Eo = Er$$

where:

Pr = revised estimate of the civilian noninstitutional population 16 years of age and over in this appendix for a given State and a given year.

Po = original estimate of civilian noninstitutional population 16 years of age and over for the same State and year, in the pre-1980 *Geographic Profile*.

Eo = original labor force, employment, or unemployment level estimate published in the same pre-1980 *Geographic Profile* report.

Er = level estimate revised to reflect undercoverage found in the 1980 decennial census.

The ratio, Pr/Po, must be applied to every level estimate in a particular year from the *Geographic Profile* for the appropriate State to derive adjusted levels.

As an example, the 1979 *Geographic Profile* shows a total 16+ population estimate of 2,727,000 and a total unemployment level of 116,000 for Alabama. The revised 1979 population estimate for Alabama in table E-1 of this appendix is 2,793,000. Therefore, the adjusted total unemployment (Er) would be:

$$Er = \frac{Pr}{Po} \cdot Eo$$

$$Er = \frac{2{,}793{,}000}{2{,}727{,}000} \times 116{,}000$$

$$Er = 119{,}000$$

The total unemployment rate of 7.1 percent found in the 1979 *Profile* would not be adjusted.

Revised estimates for SMSA's are not available.

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program. This bulletin presents data from the CPS for regions, States, and selected large metropolitan areas and central cities. It provides 1982 annual averages for the employed and the unemployed by selected demographic and economic characteristics based on population counts projected from the 1980 decennial census.

Data for earlier years based on the 1970 decennial census were published in the following reports: *Geographic Profile of Employment and Unemployment, 1979* (Report 619) and *1980* (Bulletin 2111). Data for 1980 and 1981 based on the 1980 decennial census were published in *Geographic Profile of Employment and Unemployment, 1981* (Bulletin 2156). Bulletin 2156 also provided instructions for revising earlier data to reflect the 1980 decennial census population counts.

The official Bureau of Labor Statistics (BLS) estimates for States, metropolitan areas, and central cities, which are the basis for determining the eligibility of an area for benefits under Federal economic assistance programs, result from the Federal-State Cooperative Program. BLS is responsible for establishing the estimating procedures; the State employment security agencies are responsible for developing the estimates. For all States, the District of Columbia, the Los Angeles Standard Metropolitan Statistical Area (SMSA), and New York City, the official annual average estimates are obtained directly from the CPS. For the remaining metropolitan areas and cities, the official annual average estimates are derived using a standardized procedure. Data from the CPS for metropolitan areas and cities in this bulletin are not the official BLS estimates and are provided because they are the only current source of information on demographic and economic characteristics.

Data for two metropolitan areas, New York and Minneapolis-St. Paul, relate to the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA) definition. For further information on geographic areas, see appendix C.

This bulletin was prepared in the Division of Local Area Unemployment Statistics by Sandy Grove, Vernon Irby, Denis Keyes, William Salvatore, George Schreider, and Linda Blount, under the supervision and direction of Fred R. Cronkhite.

Material in this publication is in the public domain and may, with appropriate credit, be reproduced without permission.

Section I. Estimates for Census regions and divisions	2
Tables: Census regions and divisions, 1982 annual averages:	
1. Labor force status of the civilian noninstitutional population 16 years and over by sex, age, race, Hispanic origin, and marital status	3
2. Full- and part-time status of the civilian labor force 16 years and over by sex, age, and race	8
3. Employment status of the experienced civilian labor force by occupation	10
4. Occupational distribution of employment by sex, age, and race	12
5. Employment status of experienced nonagricultural wage and salary workers excluding private household workers by industry	15
6. Industry distribution of nonagricultural wage and salary employment excluding private household workers by sex, age, and race	17
7. Persons at work by hours of work, sex, age, and race	20
8. Persons at work 1-34 hours by reason, sex, age, and race	22
9. Persons with a job but not at work by reason, sex, age, and race	24
10. Distribution of unemployed persons by reason for unemployment, sex, age, and race	26
11. Distribution of unemployed persons by duration of unemployment, sex, age, and race	28
Section II. Estimates for States	30
Charts:	
1. Changes in State unemployment rates, 1981-82	31
2. Unemployment rates by State, 1982 annual averages	31
Tables: States, 1982 annual averages:	
12. Labor force status of the civilian noninstitutional population 16 years and over by sex, age, race, Hispanic origin, and marital status	32
13. Full- and part-time status of the civilian labor force 16 years and over by sex, age, race, and Hispanic origin	49
14. Employment status of the experienced civilian labor force by occupation	54
15. Occupational distribution of employment by sex, age, race, and Hispanic origin	58
16. Employment status of the experienced civilian labor force by industry	63
17. Industry distribution of employment by sex, age, race, and Hispanic origin	66
18. Persons at work by hours of work, sex, age, and race	71
19. Persons at work 1-34 hours by reason, sex, age, and race	76
20. Persons with a job but not at work by reason	80
21. Distribution of unemployed persons by reason for unemployment, sex, age, race, and Hispanic origin	81
22. Distribution of unemployed persons by duration of unemployment, sex, age, race, and Hispanic origin	85

B. Sampling and estimation procedures and sampling error tables 122
C. Geographic boundary definitions 154

Geographic Profile of Employment and Unemployment, 1982

The Current Population Survey (CPS) is the regular monthly survey of about 60,000 households from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures.) Annual average estimates of the labor force by demographic characteristics (age, sex, and race) and the economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standard of reliability for publication. (See appendix B for an explanation of the BLS standard for publication of CPS data.) Estimates for the regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Consequently, error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

[1] Regional data are limited for population of Hispanic origin. See State and metropolitan area tables for more detailed data on the Hispanic-origin population in selected areas.

[2] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding.

Table 2. Census regions and divisions: Full- and part-time status of the civilian labor force 16 years and over by sex, age, and race, 1982 annual averages

[1] Persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

[1] Includes industrial disputes.

[2] Does not want, or unavailable for, full-time work.

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Numbers may not add to totals because of rounding.

Other marital status[2]	48	32	66.7	30	61.9	2	7.2	4.8 - 9.7

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular State, based on the sample in the State. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1982 annual averages

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1982 annual averages—Continued

(Numbers in thousands)

Employment status and State	Total	White-collar workers					Blue-collar workers					Service workers	Farm workers
		Total	Professional and technical workers	Managers and administrators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Operatives, except transport	Transport equipment operatives	Nonfarm laborers		
Unemployment rate—Continued													
Utah	7.3	4.3	2.8	3.1	5.9	5.9	11.6	8.6	17.4	[2]	13.4	9.7	[2]
Vermont	6.3	4.0	3.3	2.1	3.3	6.4	9.0	7.1	9.0	[2]	15.7	9.4	2.7
Virginia	6.5	4.0	2.3	1.8	5.5	6.3	10.5	5.3	15.8	[2]	14.1	8.2	[2]
Washington	11.2	6.4	3.0	5.7	6.3	10.3	17.5	13.0	22.7	13.3	23.3	14.9	10.9
West Virginia	12.5	5.9	2.7	3.1	8.9	9.3	19.3	15.3	21.5	17.2	26.5	14.4	[2]
Wisconsin	9.6	4.8	3.4	4.4	4.1	6.8	16.8	11.0	20.8	15.0	22.5	9.1	4.0
Wyoming	5.7	3.1	2.1	1.0	4.7	4.8	10.0	7.1	14.4	13.6	9.3	7.4	1.9

[1] Excludes persons with no previous full-time work experience.

[2] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Table 16. States: Employment status of the experienced[1] civilian labor force by industry, 1982 annual averages

(Numbers in thousands)

Employment status and State	Total[2]	Nonagricultural industries										Agriculture
		Total[3]	Private nonagricultural wage and salary workers								Government	
			Total	Construction	Manufacturing			Transportation, communications, and public utilities	Trade	Finance, insurance, and real estate	Service industries	
					Total	Durable goods	Nondurable goods

[1] Excludes persons with no previous full-time work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes private household workers and mining.

[4] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

[5] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers and mining.

[2] Includes private household workers and mining.

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Table 18. States: Persons at work by hours of work, sex, age, and race, 1982 annual averages

[1] Persons who work 35 or more hours in the survey week.

[2] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed of rounding.

[1] Includes industrial disputes.

[2] Does not want, or unavailable for, full-time work.

[3] Less than 500 persons or less than 0.05 percent.

[4] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

Table 20. States: Persons with a job but not at work by reason, 1982 annual averages

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated and married with spouse absent.

[3] These data are for the Labor Market Areas (LMA) rather than the Standard Metropolitan Statistical Area for which estimates were published in earlier years. The differences are discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

[1] Excludes persons with no previous full-time work experience.

[2] Includes farm workers

[3] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[4] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

NOTE: Items may not add to subtotals because of rounding.

Table 25. Selected metropolitan areas and cities: Occupational distribution of employment by sex, age, race, and Hispanic origin, 1982 annual averages

[1] Includes farm workers

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to total because of rounding. Data are not shown separately for racial and ethnic groups when the employment estimate for these groups is not sufficiently large to meet BLS publication standards of reliability for the particular area, based on the sample size in that area. See appendix B.

Table 26. Selected metropolitan areas and cities: Employment status of experienced[1] nonagricultural workers by industry, 1982 annual averages

(Numbers in thousands)

[1] Excludes persons with no previous full-time work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes private household workers and mining.

[4] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[5] Data are not shown when they do not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

NOTE: Items may not add to subtotals because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers, and mining.

[2] Includes private household workers and mining.

[3] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[4] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force (the total of the employed and the unemployed), unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days, are also counted as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of job-seeking. Duration of unemployment measures the length of a spell of unemployment currently in progress. Hence it should not be confused with a completed spell of unemployment.

Reasons for unemployment are divided into four major groups:

(1) Job losers—persons whose employment ended involuntarily and who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants–persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

Persons who worked 35 hours or more in the survey week are designated as working *full time*; correspondingly persons who worked between 1 and 34 hours are designated as working *part time*. Part-time workers are classified by their usual status at their present job (either full- or part-time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. Other reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, housework, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and those who usually work full time.

The *full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (part time for economic reasons), and unemployed persons seeking full-time jobs. The *part-time labor force* consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Occupation and industry data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. *The*

classifications of occupations and industries used in this bulletin are as defined in the 1970 census.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week, with all hours credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

Race and ethnic origin. Beginning with the 1981 annual averages, *Geographic Profile* presents racial data for white and black workers. Before 1981, the latter racial group was the broader "black and other" category. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders. Hispanic origin refers to person who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent, regardless of race. Estimates of sampling errors in this report for the Hispanic population are based upon those for the "black and other" population. However, since the Hispanic population is smaller, the computed sampling errors may tend to be underestimates of the true sampling error. Therefore, caution should be exercised in making comparisons using these data.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*, BLS Report 463.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population.[1] The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. Each month, over 60,000 occupied housing units are eligible for interview. Respondents are questioned to obtain information about the employment status of each household member 16 years of age and over for the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; data on members of the Armed Forces and persons under 16 are excluded from the population and labor force statistics shown in this bulletin.

Sampling procedures

The current sample encompasses 629 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia, and is based to a large extent on information about the distribution of the population as reported in the 1970 decennial census. These areas were selected by dividing the entire area of the United States into 1,931 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Each of the SMSA's defined as of the 1970 census constitutes a separate PSU.

To improve the efficiency of the sample, the 1,931 PSU's were grouped into strata. Then, either 1 or 2 PSU's were selected from each stratum, with the probability of selection proportionate to the population size (PPS) in the PSU. PSU's in strata by themselves are self-representing (SR), and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population density and growth, proportion of nonwhites, principal industry, and number of farms. PSU's selected from these strata are non-self-representing (NSR), since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected using PPS. ED's are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses to be enumerated within each designated ED are selected. Whenever possible, the four units are contiguous.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to avoid cooperation problems which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

[1] For a technical description of the CPS sampling and estimation procedures and variance estimation procedures, see Technical Paper 40, *The Current Population Survey, Design and Methodology* (Bureau of the Census, January 1978).

The basic weights, which are the inverse of the sampling ratios, are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to account for occupied sample households for which no information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

   a. *First-stage ratio estimate.* As explained above, NSR PSU's are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1970 census between the distribution of the population by race and residence in the NSR sample areas and the corresponding distribution in the entire geographic area from which the NSR areas were selected. The procedure is performed twice, once at the regional level for the 4 Census regions and then for each of the 46 States which contain NSR areas. The first-stage adjustment factors are derived using the NSR PSU's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

   b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent estimate of the entire U.S. population, and is conducted in two steps. In the first step, the sample estimates for all age-sex-race groups within each State and the District of Columbia are prorated to a monthly independent estimate of the population 16 years and over for that State. The second step is applied to a specific age-sex-race group for sample persons across all States and is a weighting of estimates from the first step to a nationwide independent estimate of the civilian noninstitutional population for each of 68 age-sex-race groups. Beginning with the 1981 annual averages, the race groups used in this step have been changed from white/nonwhite to black/nonblack. (See appendix A.)

      The entire second-stage ratio estimation procedure is iterated six times, and when completed, insures that the adjusted sample population estimates, both for the States and the national age-sex-race categories, will be virtually equal to the independent population estimates for these categories.

      The monthly independent State controls for the civilian noninstitutional population 16 years and over are based on an arithmetic extrapolation of the trend in their growth from the April 1, 1980, census count through the latest available provisional July 1 estimate, with all State estimates prorated to a current estimate of the U.S. population. A description of the methodology used to derive the independent national age-sex-race estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the final statistics for a given month, a composite estimating procedure is used which takes account of net changes in the sample results from the previous month for the continuing households of the sample (75 percent), as well as the sample results from all households for the current month. Almost all estimates of month-to-month changes are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled, and hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Vermont approximately 1 in every 300 households was sampled each month in 1982, whereas in New York the sample covered about 1 in every 1,600 households. Nevertheless, the size of the sample in New York is 4 times larger than in Vermont because New York has a larger percentage of the national population.

Prior to 1976, the sampling ratio for each household was the same in each State, approximately 1 in 1,500. Since then, the samples have been augmented in many of the smaller States to improve the reliability of the CPS data. This augmentation has affected the sampling ratios in these States, so now the probability of selecting a particular household varies considerably from State to State.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6 percent unemployment rate. Before CPS labor force data for a State or area can be used as the official estimates in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for regions, divisions, States, SMSA's, and cities for publication purposes, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas. Before estimates are published for a specific category, a predetermined "critical cell" must contain at least 30 sample cases. In addition, estimates are not published when they do not meet the comparable minimum publication standard for national CPS data. As a result of these two requirements, minimum bases for publication have been developed for each area. Table B-1 lists the minimum necessary base for publication of data in each of the regions, divisions, States, the District of Columbia, and the metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, the critical cell is the size of the labor force of the particular population group. In all other tables, the determining factor or critical cell is the size of the base of the distribution—i.e., the size of total employment or unemployment for that area or population subgroup. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-25) can be used directly to develop 90-percent confidence intervals for sample estimates. (A sampling error equals 1.645 times one standard error.) They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-10 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 9,000, and a relative sampling error of 18 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 13,000 and a relative sampling error of 13 percent.

The statement that unemployment in Alabama is between 41,000 and 59,000 in the first instance, and between 87,000 and 113,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (two chances out of three), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 9,000. At 68-percent confidence, the error would be about 5,400 (9,000 X 0.6 = 5,400). At 95-percent confidence, the error would be about 10,700 (9,000 X 1.19 = 10,710).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1981 to 1982 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where: E_1 = the sampling error of one group or year
E_2 = The sampling error of another group or year
C = the covariance (or relationship) term between E_1 and E_2
E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10.0 percent in 1979 to 8.0 percent in 1982 is significant. Assume that the labor force was about 100,000 in both years. Table B-8 in the 1979 *Geographic Profile*

gives the error for a 10.0-percent unemployment rate as 1.11, and table B-14 in this year's *Geographic Profile* gives the error for an 8.0-percent unemployment rate as 1.40. Using the formula described above, the following would result:

$$E_1 = 1.11 \qquad E_2 = 1.40$$

$$E_1^2 + E_2^2 = 3.1921$$

$$\sqrt{3.1921} = 1.79$$

Assuming a negligible "C" term, the error of the difference is about 1.8. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-10 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_S = [[(S - G) / (F - G)] \times (X - Y)] + Y$$

where:
- F = published size immediately above the size desired (200,000)
- G = published size immediately below the size desired (100,000)
- S = size desired (150,000)
- X = error of the F (18,000)
- Y = error of G (13,000)
- E_S = error of S (15,500)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from BLS on request.

Appendix C. Geographic Boundary Definitions

This appendix lists the States composing the Census divisions and regions. It also provides the geographic definitions of Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Census regions and divisions and the States they comprise are:

Northeast
- New England
  - Maine
  - New Hampshire
  - Vermont
  - Massachusetts
  - Rhode Island
  - Connecticut
- Middle Atlantic
  - New York
  - New Jersey
  - Pennsylvania

North Central
- East North Central
  - Ohio
  - Indiana
  - Illinois
  - Michigan
  - Wisconsin
- West North Central
  - Iowa
  - Missouri
  - Nebraska
  - Kansas
  - Minnesota
  - North Dakota
  - South Dakota

South
- South Atlantic
  - Delaware
  - Maryland
  - District of Columbia
  - Virginia
  - West Virginia
  - North Carolina
  - South Carolina
  - Georgia
  - Florida
- East South Central
  - Kentucky
  - Tennessee
  - Alabama
  - Mississippi
- West South Central
  - Arkansas
  - Louisiana
  - Oklahoma
  - Texas

West
- Mountain
  - Montana
  - Wyoming
  - Colorado
  - Utah
  - Idaho
  - Arizona
  - Nevada
  - New Mexico
- Pacific
  - California
  - Hawaii
  - Washington
  - Oregon
  - Alaska

The Department of Labor has used LMA's for a number of years for various administrative and programmatic purposes. The boundaries for almost all LMA's are the same as those for SMSA's, as established by the Office of Management and Budget. SMSA boundaries are defined using a specific set of criteria developed for that purpose. LMA's are determined by the State employment security agencies, using rules established by the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

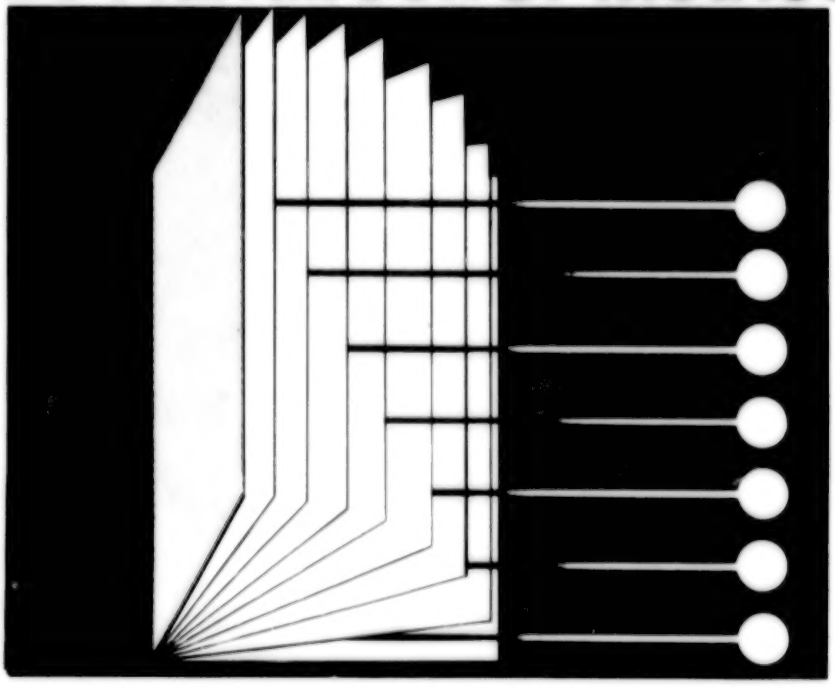
In general, an SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are

composed of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The table that follows compares the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
Anaheim-Santa Ana-Garden Grove	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same



See footnotes at end of table.

Table C-1. Continued—Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] Except for Denver-Boulder, for which the estimates are based on the 1973 SMSA geographic boundaries, all metropolitan area estimates are based on the LMA boundaries.

BLS Handbook of Methods

1982 Edition, Volume I*

BLS statistics are used for many purposes, and sometimes data well suited to one purpose may have limitations for another. This Handbook aims to provide users of BLS data with the information necessary to evaluate the suitability of the statistics for their needs. Included are program descriptions for:

- Labor force, employment, and unemployment
- Occupational employment statistics
- Consumer expenditures and income
- Producer Price Indexes
- International Price Indexes
- Occupational pay and supplementary benefits
- Negotiated wage and benefit changes
- Employment Cost Indexes
- Productivity measures
- Occupational safety and health statistics
- Economic growth studies

*Volume II, a detailed explanation of methods used to prepare Consumer Price Indexes, is in preparation.

The following BLS regional offices will expedite orders.

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program. This bulletin presents data from the CPS for regions, States, and selected large metropolitan areas and central cities. It provides 1983 annual averages for the employed and the unemployed by selected demographic and economic characteristics based on population counts projected from the 1980 decennial census.

Data for earlier years based on the 1970 decennial census were published in the following reports: *Geographic Profile of Employment and Unemployment, 1979* (Report 619) and *1980* (Bulletin 2111). Data for 1980 and 1981 based on the 1980 decennial census were published in *Geographic Profile of Employment and Unemployment, 1981* (Bulletin 2156). Bulletin 2156 also provided instructions for revising earlier data to reflect the 1980 decennial census population counts. Data for 1982 were published in *Geographic Profile of Employment and Unemployment, 1982* (Bulletin 2170).

The official Bureau of Labor Statistics (BLS) estimates for States, metropolitan areas, and central cities, which are the basis for determining the eligibility of an area for benefits under Federal economic assistance programs, result from the Federal-State Cooperative Program. BLS is responsible for establishing the estimating procedures; the State employment security agencies are responsible for developing the estimates. For all States, the District of Columbia, the Los Angeles Standard Metropolitan Statistical Area (SMSA), and New York City, the official annual average estimates are obtained directly from the CPS. For the remaining metropolitan areas and cities, the official annual average estimates are derived using a standardized procedure. Data from the CPS for metropolitan areas and cities in this bulletin are not the official BLS estimates and are provided because they are the only current source of information on demographic and economic characteristics.

Data for two metropolitan areas, New York and Minneapolis-St. Paul, relate to the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA) definition. For further information on geographic areas, see appendix C.

This bulletin was prepared in the Division of Data Development and Users' Services in collaboration with the Division of Local Area Unemployment Statistics.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

C. Geographic boundary definitions	152

Geographic Profile of Employment and Unemployment, 1983

The Current Population Survey (CPS) is the regular monthly survey of about 60,000 households from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures.) Annual average estimates of the labor force by demographic characteristics (age, sex, and race) and the economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standard of reliability for publication. (See appendix B for an explanation of the BLS standard for publication of CPS data.) Estimates for the regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Consequently, error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

Section I. Estimates for Census Regions and Divisions

Table 1. Census regions and divisions: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1983 annual averages

(Numbers in thousands)

Area and population group	Civilian non-institutional population	Civilian labor force		Employment		Unemployment		
		Number	Percent of population	Number	Percent of population	Number	Rate	Error range of rate[1]
UNITED STATES[2]								
Total	174,215	111,550	64.0	100,834	57.9	10,717	9.6	9.5 - 9.7

Other marital status[3]	4,557	2,595	56.9	2,298	50.4	296	11.4	10.5 - 12.4

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Because of separate processing and weighting procedures, totals for the United States differ from the results obtained by aggregating the totals for regions and States.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 2. Census regions and divisions: Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin, 1983 annual averages

(Numbers in thousands)

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Excludes persons with no previous work experience.

[2] Includes toys, amusement, and sporting goods.

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 6. Census regions and divisions: Civilian employment of private nonagricultural wage and salary workers, excluding private household workers, by industry, sex, race, and Hispanic origin, 1983 annual averages

[1] Includes toys, amusement, and sporting goods.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 7. Census regions and divisions: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1983 annual averages

(Numbers in thousands)

[1] Refers to persons who worked 35 hours or more during the survey week.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 8. Census regions and divisions: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1983 annual averages

(Numbers in thousands)

Hispanic origin					
South	80	33	23	4	21
West	120	56	35	8	22
Pacific	95	42	28	7	18

[1] Includes industrial disputes.

[2] Less than 500 persons.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section II. Estimates for States

Chart 1. Unemployment rates by State, 1983 annual averages

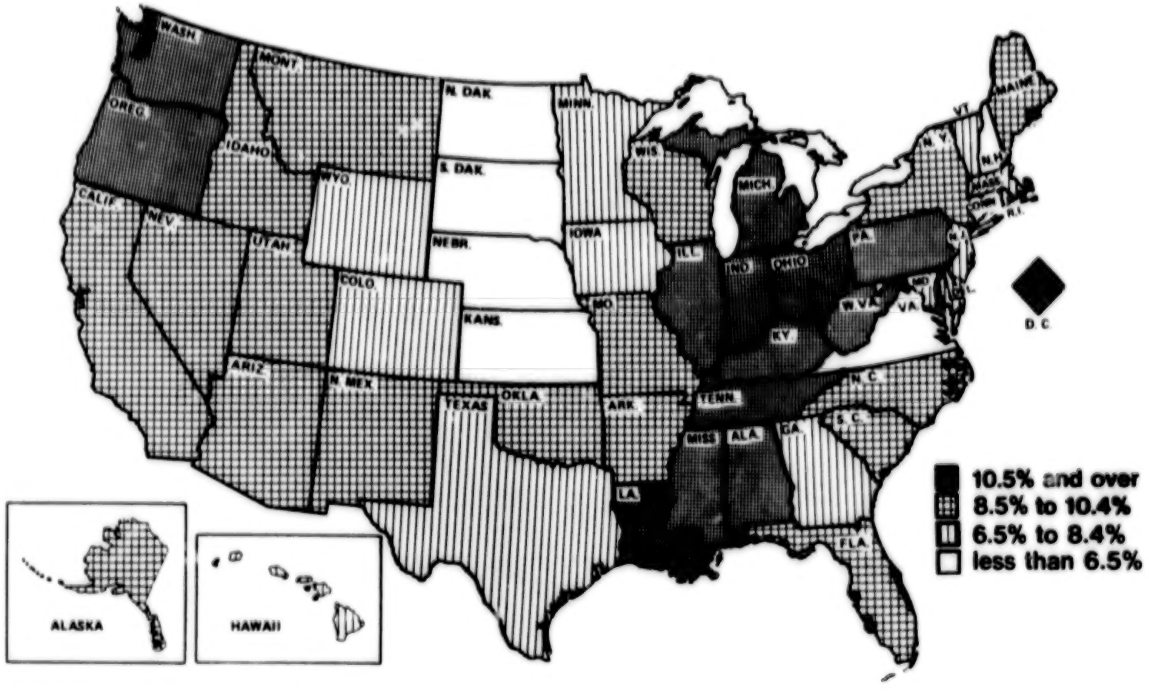

Chart 2. Changes in State unemployment rates, 1982-83

Other marital status[2]	56	37	65.7	32	57.4	5	12.6	9.7 - 15.5

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1983 annual averages

(Numbers in thousands)

Employment status and State	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

Wyoming	8.0	3.4	3.9	[2]	4.8	5.3	11.3	12.0	16.1	12.2	18.9	3.1

[1] Excludes persons with no previous work experience.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 16. States: Employment status of the experienced[1] civilian labor force by industry, 1983 annual averages

(Numbers in thousands)

[1] Excludes persons with no previous work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes self-employed and unpaid family workers and mining.

[4] Includes mining.

[5] Excludes private household workers.

[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers, and mining.

[2] Includes self-employed and unpaid family workers and mining.

[3] Includes mining.

[4] Excludes private household workers.

[5] Less than 500 persons employed or less than 0.05 percent of total employed

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 18. States: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1983 annual averages

(Numbers in thousands)

Population group and State	Total at work	Hours of work								Average hours	
		1-14 hours	15-29 hours	30-34 hours	35 hours and over	35-39 hours	40 hours	41-48 hours	49 hours and over	Total	Full-time schedules[1]

[1] Refers to persons who worked 35 hours or more during the survey week.

[2] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 19. States: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1983 annual averages

(Numbers in thousands)

Population group and State	Usually work full time								Usually work part time				
	Total	Slack work or material shortages	Job started or terminated	Holiday	Bad weather	Own illness	On vacation	Other[1]	Total	Slack work or only find part-time	Busy[2]	Full-time work less than 35 hours	Other

[1] Includes industrial disputes.

[2] Does not want, or unavailable for, full-time work.

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals because of rounding.

New York	69	100.0	63.8	16.9	6.8	13.3	16.2
Texas	179	100.0	55.9	6.4	9.6	21.6	12.9

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Texas	151	100.0	34.1	27.4	38.5	22.8
Hispanic origin						
California	301	100.0	37.4	30.0	32.6	17.3
Florida	60	100.0	37.1	22.5	40.4	19.0
New Mexico	25	100.0	32.0	35.6	32.4	18.1
New York	69	100.0	28.3	34.2	37.5	19.2
Texas	179	100.0	44.9	31.8	23.3	11.5

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section III. Estimates for Metropolitan Areas and Cities

Table 23. Selected metropolitan areas and cities: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1983 annual averages

Married, spouse present	135	81	60.5	73	54.0	9	10.8	6.9 - 14.7

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] These data are for the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area for which estimates were published in earlier years. The differences are discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 24. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force by occupation, 1983 annual averages

(Numbers in thousands)

Employment status and area	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] Excludes persons with no previous work experience.

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 25. Selected metropolitan areas and cities: Employed civilians by sex, race, Hispanic origin, and occupation, 1983 annual averages

(Percent distribution)

Population group and area	Total employed		Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
	Number (in thousands)	Percent	Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[2] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Includes self-employed and unpaid family workers and mining.
[2] Includes mining.
[3] Excludes private household workers.
[4] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for the above race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force, unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *civilian labor force* comprises all civilians classified as employed or unemployed in accordance with the criteria described below.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days, are also counted as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking. Duration of unemployment measures the length of a spell of unemployment currently in progress. Hence it should not be confused with a completed spell of unemployment.

Reasons for unemployment are divided into four major groups:
(1) Job losers—persons whose employment ended involuntarily and who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

The *unemployment rate for all civilian workers* represents the number unemployed as a percent of the civilian labor force.

The *civilian labor force participation rate* is the ratio of the civilian labor force to the civilian noninstitutional population.

The *civilian employment-population ratio* is the percentage of all employed civilians in the civilian noninstitutional population.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the joliday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week with all hours credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

Persons who worked 35 hours or more in the survey week are designated as working *full time;* correspondingly, persons who worked between 1 and 34

hours are designated as working *part time*. Part-time workers are classified by their usual status at their present job (either full- or part-time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. Other reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, housework, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The *full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (part time for economic reasons), and unemployed persons seeking full-time jobs. The *part-time labor force* consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Occupational and industry data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. Beginning with 1983 data, all occupational and industry data presented in this bulletin are coded according to the classification systems used in the 1980 census, rather than the 1970 census systems used through 1982. While this conversion had little effect on industry-related data, the new occupational categories are so radically different that their implementation represents a break in historical data series. Additional information on the 1980 census occupational and industrial classification systems appears in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of *Employment and Earnings*.

Race and Hispanic origin. Beginning with 1981 annual averages, *Geographic Profile* presents racial data for white and black workers. Before 1981, racial data were published for white and "black and other" workers. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders. *Hispanic* origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent, regardless of race. Estimates of sampling errors in this report for the Hispanic population are based upon those for the "black and other" population. However, since the Hispanic population is smaller, the computed sampling errors may tend to be underestimates of the true sampling error. Therefore, caution should be exercised in making comparisons using these data.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey* (BLS Report 463) and the Explanatory Notes of the BLS monthly publication *Employment and Earnings*.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population.[1] The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. Each month, over 60,000 occupied housing units are eligible for interview. Respondents are questioned to obtain information about the employment status of each household member 16 years of age and over for the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; data on members of the Armed Forces and persons under 16 are excluded from the population and labor force statistics shown in this bulletin.

Sampling procedures

The current sample encompasses 629 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia, and is based to a large extent on information about the distribution of the population as reported in the 1970 decennial census. These areas were selected by dividing the entire area of the United States into 1,931 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Each of the SMSA's defined as of the 1970 census constitutes a separate PSU.

To improve the efficiency of the sample, the 1,931 PSU's were grouped into strata. Then, either 1 or 2 PSU's were selected from each stratum, with the probability of selection proportionate to the population size (PPS) in the PSU. PSU's in strata by themselves are self-representing (SR), and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population density and growth, proportion of nonwhites, principal industry, and number of farms. PSU's selected from these strata are non-self-representing (NSR), since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected using PPS. ED's are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses to be enumerated within each designated ED are selected. Whenever possible, the four units are contiguous.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to avoid cooperation problems which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

[1] For a technical description of the CPS sampling and estimation procedures and variance estimation procedures, see Technical Paper 40, *The Current Population Survey, Design and Methodology* (Bureau of the Census, January 1978).

The basic weights, which are the inverse of the sampling ratios, are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to account for occupied sample households for which no information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

   a. *First-stage ratio estimate.* As explained above, NSR PSU's are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1980 census between the distribution of the population by race and residence in the NSR sample areas and the corresponding distribution in the entire geographic area from which the NSR areas were selected. The procedure is performed twice, once at the regional level for the 4 Census regions and then for each of the 46 States which contain NSR areas. The first-stage adjustment factors are derived using the NSR PSU's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

   b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent estimate of the entire U.S. population, and is conducted in two steps. In the first step, the sample estimates for all age-sex-race groups within each State and the District of Columbia are prorated to a monthly independent estimate of the population 16 years and over for that State. The second step is applied to a specific age-sex-race group for sample persons across all States and is a weighting of estimates from the first step to a nationwide independent estimate of the civilian noninstitutional population for each of 68 age-sex-race groups. Beginning with the 1981 annual averages, the race groups used in this step have been changed from white/nonwhite to black/nonblack. (See appendix A.)

      The entire second-stage ratio estimation procedure is iterated six times, and when completed, insures that the adjusted sample population estimates, both for the States and the national age-sex-race categories, will be virtually equal to the independent population estimates for these categories.

      The monthly independent State controls for the civilian noninstitutional population 16 years and over are based on an arithmetic extrapolation of the trend in their growth from the April 1, 1980, census count through the latest available provisional July 1 estimate, with all State estimates prorated to a current estimate of the U.S. population. A description of the methodology used to derive the independent national age-sex-race estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the final statistics for a given month, a composite estimating procedure is used which takes account of net changes in the sample results from the previous month for the continuing households of the sample (75 percent), as well as the sample results from all households for the current month. Almost all estimates of month-to-month changes are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled, and hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Vermont approximately 1 in every 300 households was sampled each month in 1983, whereas in New York the sample covered about 1 in every 1,600 households. Nevertheless, the size of the sample in New York is 4 times larger than in Vermont because New York has a larger percentage of the national population.

Prior to 1976, the sampling ratio for each household was the same in each State, approximately 1 in 1,500. Since then, the samples have been augmented in many of the smaller States to improve the reliability of the CPS data. This augmentation has affected the sampling ratios in these States, so now the probability of selecting a particular household varies considerably from State to State.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6 percent unemployment rate. Before CPS labor force data for a State or area can be used as the official estimates in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for regions, divisions, States, SMSA's, and cities for publication purposes, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas. Before estimates are published for a specific category, a predetermined "critical cell" must contain at least 30 sample cases. In addition, estimates are not published when they do not meet the comparable minimum publication standard for national CPS data. As a result of these two requirements, minimum bases for publication have been developed for each area. Table B-1 lists the minimum necessary base for publication of data in each of the regions, divisions, States, the District of Columbia, and the metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, the critical cell is the size of the labor force of the particular population group. In all other tables, the determining factor or critical cell is the size of the base of the distribution—i.e., the size of total employment or unemployment for that area or population subgroup. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-25) can be used directly to develop 90-percent confidence intervals for sample estimates. (A sampling error equals 1.645 times one standard error.) They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-10 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 9,000, and a relative sampling error of 18 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 13,000 and a relative sampling error of 13 percent.

The statement that unemployment in Alabama is between 41,000 and 59,000 in the first instance, and between 87,000 and 113,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (two chances out of three), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 9,000. At 68-percent confidence, the error would be about 5,400 (9,000 X 0.6 = 5,400). At 95-percent confidence, the error would be about 10,700 (9,000 X 1.19 = 10,710).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1982 to 1983 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where: E_1 = the sampling error of one group or year
E_2 = The sampling error of another group or year
C = the covariance (or relationship) term between E_1 and E_2
E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10.0 percent in 1979 to 8.0 percent in 1983 is significant. Assume that the labor force was about 100,000 in both years. Table B-8 in the 1979 *Geographic Profile*

gives the error for a 10.0-percent unemployment rate as 1.11, and table B-14 in this year's *Geographic Profile* gives the error for an 8.0-percent unemployment rate as 1.40. Using the formula described above, the following would result:

$$E_1 = 1.11 \qquad E_2 = 1.40$$

$$E_1^2 + E_2^2 = 3.1921$$

$$\sqrt{3.1921} = 1.79$$

Assuming a negligible "C" term, the error of the difference is about 1.8. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-10 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_S = [[(S - G) \ / \ (F - G)] \times (X - Y)] + Y$$

where:
- F = published size immediately above the size desired (200,000)
- G = published size immediately below the size desired (100,000)
- S = size desired (150,000)
- X = error of the F (18,000)
- Y = error of G (13,000)
- E_S = error of S (15,500)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from BLS on request.

Appendix C. Geographic Boundary Definitions

This appendix lists the States composing the Census divisions and regions. It also provides the geographic definitions of Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Census regions and divisions and the States they comprise are:

Northeast
- New England
  - Maine
  - New Hampshire
  - Vermont
  - Massachusetts
  - Rhode Island
  - Connecticut
- Middle Atlantic
  - New York
  - New Jersey
  - Pennsylvania

North Central
- East North Central
  - Ohio
  - Indiana
  - Illinois
  - Michigan
  - Wisconsin
- West North Central
  - Iowa
  - Missouri
  - Nebraska
  - Kansas
  - Minnesota
  - North Dakota
  - South Dakota

South
- South Atlantic
  - Delaware
  - Maryland
  - District of Columbia
  - Virginia
  - West Virginia
  - North Carolina
  - South Carolina
  - Georgia
  - Florida
- East South Central
  - Kentucky
  - Tennessee
  - Alabama
  - Mississippi
- West South Central
  - Arkansas
  - Louisiana
  - Oklahoma
  - Texas

West
- Mountain
  - Montana
  - Wyoming
  - Colorado
  - Utah
  - Idaho
  - Arizona
  - Nevada
  - New Mexico
- Pacific
  - California
  - Hawaii
  - Washington
  - Oregon
  - Alaska

The Department of Labor has used LMA's for a number of years for various administrative and programmatic purposes. The boundaries for almost all LMA's are the same as those for SMSA's, as established by the Office of Management and Budget. SMSA boundaries are defined using a specific set of criteria developed for that purpose. LMA's are determined by the State employment security agencies, using rules established by the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

In general, an SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are

composed of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The table that follows compares the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
Anaheim-Santa Ana-Garden Grove ..	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same

See footnotes at end of table.

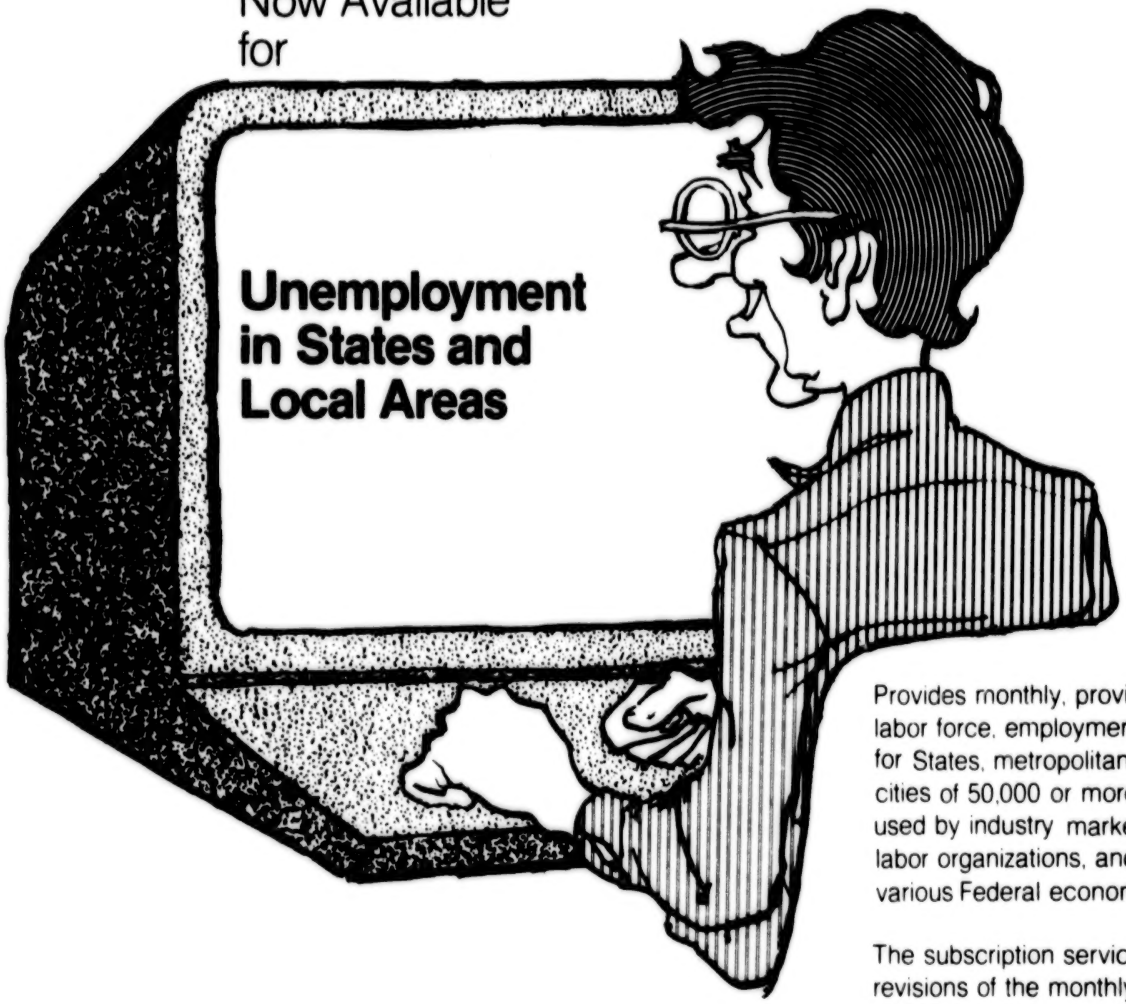

Table C-1. Continued—Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] Except for Denver-Boulder, for which the estimates are based on the 1973 SMSA geographic boundaries, all metropolitan area estimates are based on the LMA boundaries.

Service
Now Available
for

Unemployment in States and Local Areas

Provides monthly, provisional estimates of the labor force, employment, and unemployment, for States, metropolitan areas, counties, and cities of 50,000 or more. These estimates are used by industry marketing departments, by labor organizations, and by administrators of various Federal economic assistance programs.

The subscription service also includes annual revisions of the monthly data and supplemental material issued on an irregular basis. One year subscription: $50.00

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program. This bulletin presents data from the CPS for regions, States, and selected large metropolitan areas and central cities. It provides 1984 annual averages for the employed and the unemployed by selected demographic and economic characteristics based on population counts projected from the 1980 decennial census.

Comparable data for 1980-83 were published in *Geographic Profile of Employment and Unemployment* as follows: 1983, Bulletin 2216; 1982, Bulletin 2170; and 1981 and 1980, Bulletin 2156. Bulletin 2156 also provided instructions for adjusting 1970 census-based data for earlier years to reflect 1980 census population counts.

The name of the North Central region has been changed to the Midwest region. There has been no change in the component States or census divisions. Revised 1983 definitions for metropolitan areas based on guidelines and standards established by the Office of Management and Budget will be introduced in this report with the publication of 1985 annual averages.

National 1984 annual averages for persons of Hispanic origin have been revised to reflect new population controls introduced in January 1985. Subnational data shown in this bulletin for the Hispanic population have not been revised due to the absence of separate controls for States, regions, or areas.

The official Bureau of Labor Statistics (BLS) estimates for States, metropolitan areas, and central cities, which are the basis for determining the eligibility of an area for benefits under Federal economic assistance programs, result from the Federal-State Cooperative Program. BLS is responsible for establishing the estimating procedures; the State employment security agencies are responsible for developing the estimates. For all States, the District of Columbia, the Los Angeles Standard Metropolitan Statistical Area (SMSA), and New York City, the official annual average estimates are obtained directly from the CPS. For the remaining metropolitan areas and cities, the official annual average estimates are derived using a standardized procedure. Data from the CPS for metropolitan areas and cities in this bulletin are not the official BLS estimates and are provided because they are the only current source of information on demographic and economic characteristics.

Data for two metropolitan areas, New York and Minneapolis-St. Paul, relate to the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA) definition. For further information on geographic areas, see appendix C.

This bulletin was prepared in the Division of Data Development and Users' Services in collaboration with the Division of Local Area Unemployment Statistics.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

Geographic profile of employment and umemployment, 1984 1

Section I. Estimates for Census regions and divisions 2
Tables: Census regions and divisions, 1984 annual averages:
1. Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status 3
2. Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin 8
3. Employment status of the experienced civilian labor force by occupation 10
4. Employed civilians by occupation, sex, race, and Hispanic origin 13
5. Employment status of the experienced civilian labor force for private nonagricultural wage and salary workers, excluding private household workers, by industry 17
6. Civilian employment of private nonagricultural wage and salary workers, excluding private household workers, by industry, sex, race, and Hispanic origin ... 19
7. Civilians at work by sex, age, race, Hispanic origin, and hours of work 23
8. Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status 25
9. Employed civilians with a job but not at work by sex, age, race, Hispanic origin, and reason not at work 27
10. Unemployed persons by sex, age, race, Hispanic origin, and reason for unemployment 29
11. Unemployed persons by sex, age, race, Hispanic origin, and duration of unemployment 31

Section II. Estimates for States 33
Charts:
1. Unemployment rates by State, 1984 annual averages 34
2. Changes in State unemployment rates, 1983-84 34

Tables: States, 1984 annual averages:
12. Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status 35
13. Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin 49
14. Employment status of the experienced civilian labor force by occupation 54
15. Employed civilians by sex, race, Hispanic origin, and occupation 58
16. Employment status of the experienced civilian labor force by industry 62
17. Employed civilians by sex, race, Hispanic origin, and industry 65
18. Civilians at work by sex, age, race, Hispanic origin, and hours of work 69
19. Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status 74
20. Employed civilians with a job but not at work by reason 78
21. Unemployed persons by sex, age, race, Hispanic origin, and reason for unemployment 79
22. Unemployed persons by sex, age, race, Hispanic origin, and duration of unemployment 83

Section III. Estimates for metropolitan areas and cities	87
Tables: Metropolitan areas and cities, 1984 annual averages:	
23. Employment status of the civlian noninstitutional population by sex, age, race, Hispanic origin, and marital status	88
24. Employment status of the experienced civilian labor force by occupation	99
25. Employed civilians by sex, race, Hispanic origin, and occupation	102
26. Employment status of the experienced civilian labor force for nonagricultural workers by industry	106
27. Employed civilians in nonagricultural industries by sex, race, and Hispanic origin	108
Appendixes:	
A. Definitions of data derived from the Current Population Survey	112
B. Sampling and estimation procedures and sampling error tables	114
C. Geographic boundary definitions	146

Geographic Profile of Employment and Unemployment, 1984

The Current Population Survey (CPS) is the regular monthly survey of about 60,000 households (59,500 beginning in 1985) from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures. Changes in the estimation procedures used in the CPS, which were introduced in the national estimates in January 1985, will be incorporated in this report with the publication of 1985 annual data.)

Annual average estimates of the labor force by demographic characteristics (age, sex, race, and Hispanic origin) and the economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standard of reliability for publication. (See appendix B for an explanation of the BLS standard for publication of CPS data.) Estimates for the regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Consequently, error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

Section I. Estimates for Census Regions and Divisions

Table 1. Census regions and divisions: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1984 annual averages

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Because of separate processing and weighting procedures, totals for the United States differ from the results obtained by aggregating the totals for regions and States.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 2. Census regions and divisions: Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin, 1984 annual averages

(Numbers in thousands)

Pacific	1,882	1,520	157	205	10.9	227	191	36	15.7

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Excludes persons with no previous work experience.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Farm operators and managers	(1)	(1)	(1)	.3	.2	.6	.1	.3	(2)	.1	.4	.8	.3

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 5. Census regions and divisions: Employment status of the experienced[1] civilian labor force for private nonagricultural wage and salary workers, excluding private household workers, by industry, 1984 annual averages

[1] Excludes persons with no previous work experience.

[2] Includes toys, amusement, and sporting goods.

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes toys, amusement, and sporting goods.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 7. Census regions and divisions: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1984 annual averages

(Numbers in thousands)

[1] Refers to persons who worked 35 hours or more during the survey week.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 8. Census regions and divisions: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1984 annual averages

(Numbers in thousands)

Population group and area	Usually work full time								Usually work part time				
	Total	Slack work or material shortages	Job started or terminated	Holiday	Bad weather	Own illness	On vacation	Other[1]	Total	Slack work or could find only part-time work	Does not want full-time work[2]	Full-time work less than 35 hours	Other

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See Appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section II. Estimates for States

Chart 1. Unemployment rates by State, 1984 annual averages

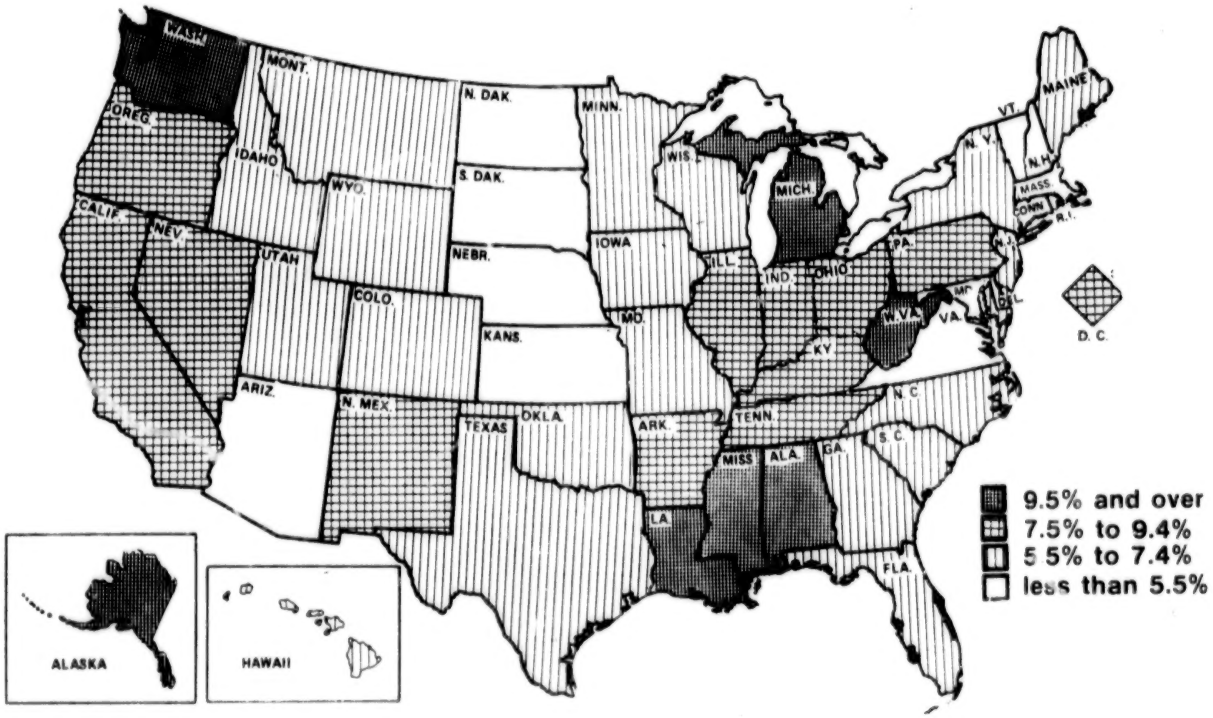

Chart 2. Changes in State unemployment rates, 1983-84

Table 12. States: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1984 annual averages—Continued

(Numbers in thousands)

State and population group	Civilian noninstitutional population	Civilian labor force		Employment		Unemployment		
		Number	Percent of population	Number	Percent of population	Number	Rate	Error range of rate[1]
Wyoming								
Total	360	254	70.4	238	66.0	16	6.3	5.5 - 7.1
Men	180	148	82.5	138	76.7	10	7.0	5.8 - 8.1
Women	180	105	58.4	100	55.3	6	5.4	4.2 - 6.5
Both sexes, 16 to 19 years	30	17	57.3	15	49.1	2	14.2	9.7 - 18.7
White	352	248	70.5	233	66.3	15	5.9	5.1 - 6.7
Men	176	145	82.5	136	77.2	9	6.5	5.4 - 7.6
Women	176	103	58.4	96	55.4	5	5.1	3.9 - 6.3
Both sexes, 16 to 19 years	29	17	57.0	14	49.5	2	13.1	8.7 - 17.5
Single (never married)	79	58	73.0	52	65.7	6	9.9	7.8 - 12.0
Married, spouse present	225	161	71.5	153	68.1	8	4.8	3.8 - 5.7
Other marital status[2]	56	35	62.7	32	58.0	3	7.5	5.1 - 9.9

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 13. States: Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin, 1984 annual averages

Texas	1,258	1,042	105	111	8.8	143	120	23	15.8

[1] Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1984 annual averages

(Numbers in thousands)

Employment status and State	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1984 annual averages—Continued

(Numbers in thousands)

Employment status and State	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers	
UNEMPLOYMENT RATE—Continued												
South Dakota	4.0	3.0	1.7	[2]	2.9	2.3	5.7	4.9	8.7	4.7	9.2	2.1
Tennessee	7.2	2.2	1.8	[2]	4.8	4.1	10.7	8.2	10.3	7.6	18.6	7.5
Texas	5.3	1.7	1.9	3.2	5.2	4.1	7.8	6.0	7.3	7.5	12.5	6.5
Utah	5.8	2.3	2.0	[2]	4.3	4.3	7.9	7.5	10.5	13.2	9.7	[2]
Vermont	4.8	.9	2.5	[2]	3.8	4.1	5.0	5.1	9.4	10.2	[2]	3.0
Virginia	4.4	1.3	2.7	[2]	4.2	2.8	6.4	4.6	6.4	4.2	10.3	[2]
Washington	8.8	2.9	3.6	[2]	7.2	7.3	10.7	8.8	19.5	10.0	20.3	14.2
West Virginia	13.6	4.8	1.9	[2]	9.4	10.1	15.2	19.0	17.0	19.6	30.3	[2]
Wisconsin	6.2	2.6	2.8	[2]	4.7	5.0	7.4	9.0	8.4	8.1	10.1	7.0
Wyoming	6.0	1.6	2.7	[2]	5.1	3.1	8.7	8.2	[2]	8.8	13.0	6.8

[1] Excludes persons with no previous work experience.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Less than 500 persons employed or less than 0.05 percent of total employed

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Excludes persons with no previous work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes self-employed and unpaid family workers and mining.

[4] Includes mining.

[5] Excludes private household workers.

[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers, and mining.
[2] Includes self-employed and unpaid family workers and mining.
[3] Includes mining.
[4] Excludes private household workers.
[5] Less than 500 persons employed or less than 0.05 percent of total employed

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 18. States: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1984 annual averages

(Numbers in thousands)

Population group and State	Total at work	Hours of work								Average hours	
		1-14 hours	15-29 hours	30-34 hours	35 hours and over	35-39 hours	40 hours	41-48 hours	49 hours and over	Total	Full-time schedules[1]

Texas	1,209	61	127	92	929	73	596	122	138	38.2	43.2

[1] Refers to persons who worked 35 hours or more during the survey week.
[2] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 19. States: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1984 annual averages

(Numbers in thousands)

Population group and State	Usually work full time								Usually work part time				
	Total	Slack work or material shortages	Job started or terminated	Holiday	Bad weather	Own illness	On vacation	Other[1]	Total	Slack work or only find part-time	Does not want full-time work[2]	Full-time work less than 35 hours	Other

Table 21. States: Unemployed persons by sex, age, race, Hispanic origin, and reason for unemployment, 1984 annual averages—Continued

(Percent distribution)

Population group and State	Total unemployed		Reason for unemployment				
	Number (in thousands)	Percent	Job losers		Job leavers	Reentrants	New entrants
			Total	On layoff			
Hispanic origin							
California	233	100.0	64.6	14.8	8.6	14.8	12.1
New Mexico	20	100.0	53.8	4.8	8.4	24.4	13.3
New York	76	100.0	50.6	10.3	7.0	23.9	18.4
Texas	134	100.0	48.6	5.2	9.3	28.4	13.7

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 22. States: Unemployed persons by sex, age, race, Hispanic origin, and duration of unemployment, 1984 annual averages

Table 22. States: Unemployed persons by sex, age, race, Hispanic origin, and duration of unemployment, 1984 annual averages—Continued

(Percent distribution)

Population group and State	Total unemployed		Duration of unemployment			
	Number (in thousands)	Percent	Less than 5 weeks	5-14 weeks	15 weeks and over	27 weeks and over
Hispanic origin						
California	233	100.0	45.6	27.9	26.5	13.3
New Mexico	20	100.0	36.9	36.5	26.7	14.2
New York	76	100.0	35.9	34.3	29.8	14.6
Texas	134	100.0	48.6	30.3	21.1	8.7

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section III. Estimates for Metropolitan Areas and Cities

Table 23. Selected metropolitan areas and cities: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1984 annual averages

(Numbers in thousands)
